

Epics:

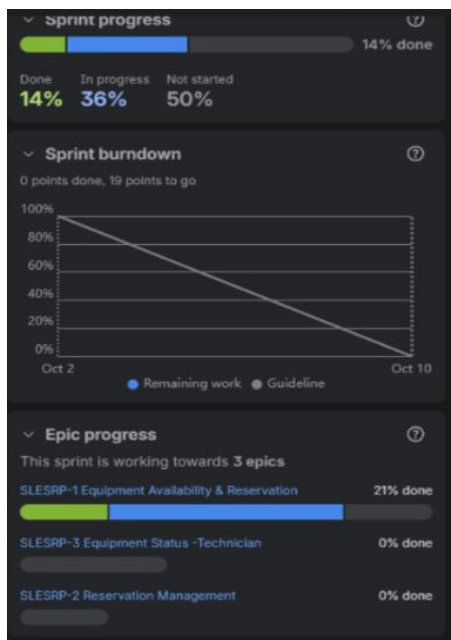

Sprint 1:

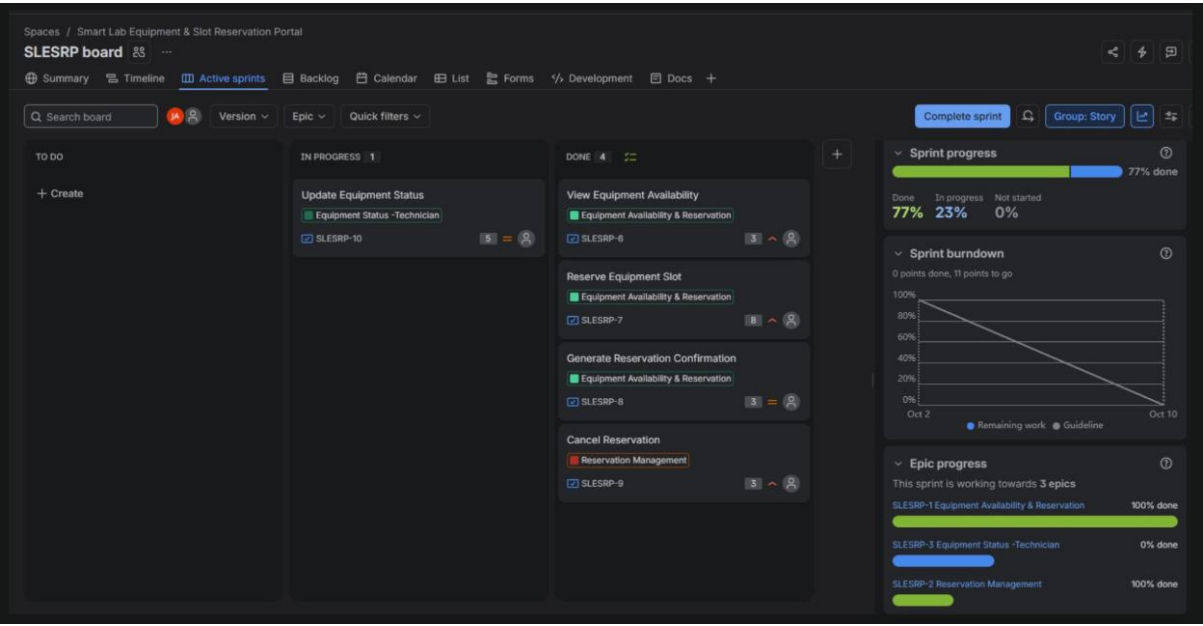

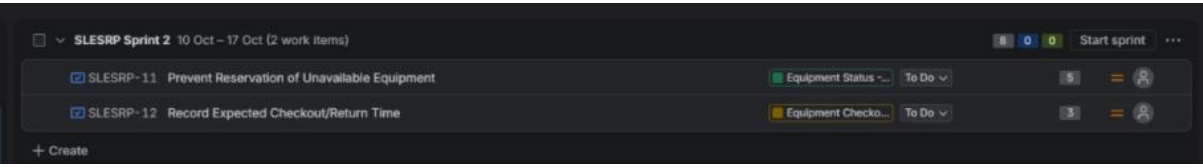

Burndown and Sprint , Epic Progress :

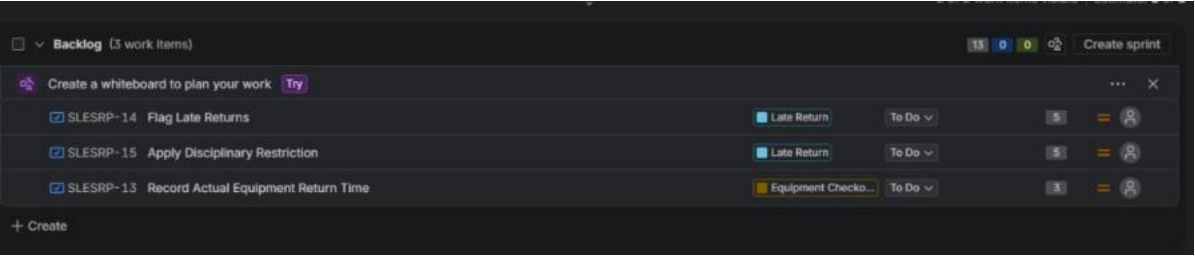

Progress and burndown chart with all Todo's Done :

Sprint 2:

Backlogs

Reflection

1. Did your estimations reflect the actual effort?

The story points provided a relative estimate of the complexity and effort required for each user story. During the simulated sprint, the estimates were useful for understanding which stories required more effort, although actual effort may vary during implementation.

2. Was your backlog well-prioritized?

The backlog was prioritized according to the importance of the functionality. High-priority stories related to core reservation and equipment management were considered before medium-priority usage tracking and disciplinary functionality.

3. How did your simulated sprint align with your plan?

The sprint was planned by selecting important user stories from the backlog and progressing them through the Scrum workflow from To Do > In Progress > Done. The simulation helped demonstrate how planned work can be tracked during a sprint.

4. What insights did the burndown chart give about team capacity?

The burndown chart provided a visual representation of completed and remaining work during the sprint. It helped understand the rate at which work was completed and whether the planned workload was being completed consistently.
